

ABSTRACT OF THE DISCLOSURE

A single use applicator for applying an adhesive material, particularly for medical use, includes a semi-rigid base strip having a longitudinal direction, and a reservoir containing an adhesive material, the reservoir being secured to one side of the base strip. The base strip is arranged to be folded about an axis substantially perpendicular to the longitudinal direction such that a portion of the reservoir is ruptured and pressure is applied on the reservoir to expel the adhesive material from the ruptured reservoir. In embodiments, the base strip has a hole formed therethrough and a projection corresponding to the hole formed on one side thereof. The reservoir is disposed over the hole on a side of the base strip opposite the one side on which the projection is formed. When the base strip is folded, the projection extends into the hole to apply pressure on the reservoir.
